INTELLECTUAL PROPERTY SECURITY AGREEMENT

THIS INTELLECTUAL PROPERTY SECURITY AGREEMENT (this "Agreement"), effective as of October 10, 2018, is made by and between **SHOPKEEP INC.**, a Delaware corporation ("Grantor"), and **ORIX GROWTH CAPITAL, LLC**, a Delaware limited liability company ("Lender"). Capitalized terms used in this Agreement which are not defined herein shall have the meanings set forth in the Loan Agreement (as defined below).

WHEREAS, Lender and Grantor are parties to that certain Loan and Security Agreement dated as of the date hereof (as amended, restated, amended and restated, supplemented or otherwise modified from time to time, the "Loan Agreement"); and

WHEREAS, pursuant to the Loan Agreement, Grantor has granted to Lender a security interest in all of its Collateral, including, without limitation, all Intellectual Property (including, without limitation, the Intellectual Property described herein).

NOW, THEREFORE, for good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, and intending to be legally bound, Grantor hereby represents, warrants, covenants and agrees as follows:

1. **Grant of Security Interest.** To secure all of Grantor's Obligations to Lender, Grantor grants and pledges to Lender a security interest in all of Grantor's right, title and interest in, to and under its Intellectual Property, including, without limitation: (a) the trademarks and servicemarks listed on **Schedule A** hereto, together with the goodwill connected with the use thereof and symbolized thereby, whether registered or not, and all applications to register and registrations of the same and like protections, but excluding the United States intent-to-use trademark applications to the extent that, and solely during the period in which, the grant of a security interest therein would impair, under applicable federal law, the registrability of such applications or the validity or enforceability of registrations issuing from such applications, (b) the patents and patent applications listed on **Schedule B** hereto and all like protections including, without limitation, all improvements, provisionals, divisionals, continuations, renewals, reissues, extensions and continuations-in-part of the same, (c) all copyrights, maskworks, software, computer programs and other works of authorship, whether registered or unregistered (including all works based on or derived from or incorporating) and including, without limitation, those registered copyrights listed on **Schedule C** hereto, and all extensions and renewals thereof, (d) all rights to recover for past or future infringement of any of the foregoing, (e) all domain name registrations, together with all goodwill of the business connected with or symbolized by the domain names, including, without limitation, those domain name registrations listed on **Schedule D** hereto, (f) all right, title and interest in and to any and all present and future license agreements with respect to any of the foregoing, (g) all present and future accounts, accounts receivable and other rights to payment arising from, in connection with or relating to any of the foregoing, (h) all proceeds and products of the foregoing, including, without limitation, all payments under insurance or any indemnity or warranty payable with respect to any of the foregoing; and (i) all rights of any kind whatsoever of Grantor accruing under any of the foregoing provided by applicable law of any jurisdiction, by international treaties and conventions, and otherwise throughout the world.

2. **Representations and Warranties.** Grantor represents and warrants that: (a) listed on **Schedule A** hereto are all unregistered trademarks, and service marks, trademark and service mark registrations and pending trademark and service mark applications owned by Grantor, (b) listed on **Schedule B** are all issued patents and patent applications owned by Grantor, (c) listed on **Schedule C** are

all copyrights, whether or not copyrightable, copyright applications, and copyright registrations owned by Grantor, and (d) listed on **Schedule D** are all domain name registrations owned by Grantor.

3. Recordation. Grantor authorizes the Commissioner for Patents, the Commissioner for Trademarks and the Register of Copyrights and any domain name registry or other government officials to record and register this Agreement upon request by Lender.

4. Loan Documents. This Agreement has been entered into pursuant to and in conjunction with the Loan Agreement, which is hereby incorporated by reference. The provisions of the Loan Agreement shall supersede and control over any conflicting or inconsistent provision herein. The rights and remedies of Lender with respect to the Collateral are as provided by the Loan Agreement and related documents, and nothing in this Agreement shall be deemed to limit such rights and remedies.

5. Execution in Counterparts. This Agreement may be executed in counterparts (and by different parties hereto in different counterparts), each of which shall constitute an original, but all of which when taken together shall constitute a single contract. Delivery of an executed counterpart of a signature page to this Agreement by facsimile or in electronic (i.e., "pdf" or "tif" format) shall be effective as delivery of a manually executed counterpart of this Agreement.

6. Successors and Assigns. This Agreement will be binding on and shall inure to the benefit of the parties hereto and their respective successors and assigns.

7. Governing Law. This Agreement and all acts, transactions disputes and controversies arising hereunder or relating hereto, and all rights and obligations of Lender and Grantor shall be governed by, and construed in accordance with the internal laws of the State of New York without regard to conflict of laws principles, provided that Lender shall retain all rights arising under federal law.

[signatures on next page]

IN WITNESS WHEREOF, intending to be legally bound, Grantor has caused this Agreement to be duly executed as of the date first above written.

A System and Method for Remote Management of Sale Transaction Data	SK___2	US	13/037,048 **9,317,844**	Filed: 2/28/2011 Priority to 3/2/2010 Issued: 4/19/2016	**Issued**	**Claim 1**: A method executed by a computer system comprised of at least one server that has a database that has at least one portion associated with at least one vendor of a plurality of vendors that utilize the database and a remote computer operating as a point of sale register terminal, said register terminal being connected to the server using a data network and said register terminal executing a register instance associated with a vendor that is one of the at least one vendors, said register instance being comprised of a data storage module for storing at least one transaction data comprised of inventory data, said transaction data being associated with a at least one sale transaction input into the register terminal comprising: receiving through the data network data from the register instance transaction data comprised of inventory data associated with the at least one sale transaction input into the register terminal where the receiving transaction data step is performed automatically in response to the system detecting the condition that the data network connection between the register instance and the server has been restored; receiving an authorization token through the data network data from the register instance; executing automatically a computer security protocol that ensures that the register instance operating on the register terminal has access only to that portion of the database that is associated with the vendor that is associated with the register instance by confirmation that the received authorization token is associated with the vendor and in dependence on such confirmation, updating the portion of the database associated with the vendor associated with the register instance by using the received inventory data.	1st maintenance fee window opens April 19, 2019 and closes on April 19, 2020
Graphical User Interface for a Point of Sale Device	SK___3 D	US	29/417,045 **D735,218**	Filed on: 3/29/2012 Priority to 3/29/2012 Issued: 7/28/2015	**Issued**		Window to file renewal opens on July 28, 2018

Method and System for Secure Key Rotation	SK___4	US	13/798,832 9,953,317	Filed: 3/13/2013 Priority to 3/13/2013 Issued: 4/24/18	**Issued**	1. **Claim 1**: 2. A computer system for executing electronic payment transactions while conducting a key rotation and re-keying comprising: a transaction server comprised of memory comprised of a first decryption key and a second decryption key corresponding to a first key identifier and a second key identifier stored in the memory, the transaction server further comprised of a data structure representing a key table, said key table comprised of data representing a third key identifier and a fourth key identifier; the transaction server further comprised of logic configured to: receive from the key table the third key identifier and the fourth key identifier; receive a first encrypted data representing a first payment token encrypted by a third encryption key and a second encrypted data representing the first payment token encrypted by a fourth encryption key, each of the third and fourth encryption keys corresponding to the third and fourth key identifiers comprising the key table; determine which one of either the third or fourth key identifiers correspond to the first or second key identifiers; select one of the first or second received encrypted data that corresponds to the determined one of the third or fourth key identifiers; and decrypt the selected received encrypted data using the one of the first or second decryption keys whose key identifier was determined to correspond to the third or fourth key identifier ; and a keying server comprised of logic configured to: receive the first and the second key identifiers, where the first key identifier corresponds to the youngest of the first or second encryption keys; receive the third and the fourth key identifiers; receive the first encrypted data and the second encrypted data; determine whether the pair of third and fourth key identifiers fail to correspond to the pair of first and second key identifiers, and in dependence on such determination, decrypting whichever of the first or second encrypted data corresponds to the fourth key identifier and re-encrypting the decrypted data using the first encryption key that corresponds to the younger of the first or second encryption keys.	3. Issued

A System and Method for Remote Management of Sale Transaction Data	SK___5 U	US	14/622,235 9,965,755	Filed: 2/13/2015 Priority to 2/28/2011 Issued 5/8/2018	**Issued**	**Claim 1:** A system for managing retail transaction data comprising: a first computer comprised of an instance of register software whose memory contains data representing an identifier unique to the instance of register software, and a unique identifier associated with an authorized user of the first computer, where the first computer is operatively connected to a server system using a data network, said register instance adapted by program logic to process point of sale transactions and transmit transaction data to the server; a server system connected to the first computer by the data network, said server system comprised of a database comprised of data records representing the received transaction data, each data record associated with the authorized user of the register instance that the transaction data was received from, by an owner tag that corresponds to each said transaction data records, said owner tag comprised of an identifier representing the authorized user of the register instance, each of said data records comprised of a corresponding data tag representing at least the logic state of open or closed, where the server system is further adapted by logic to modify the transaction data records as a result of the server system receiving from the first computer the identifier representing the authorized user and the server system verifying that the received identifier is associated with the user identifier comprising the owner tags; whereby the server system is further adapted by logic to receive from the register instance a data message representing the condition that the authorized user of the register instance has selected an end of shift command on the register instance and automatically in response to such reception, the server system automatically selecting from the database a plurality of the transaction data records associated with the authorized user by comparing the identifier representing the authorized user with the owner tag data associated with the transaction data records and changing the data tag corresponding to those selected data records to the closed state.	

A System and Method for Remote Management of Sale Transaction Data	SK___8 U	US	14747828	Filed: 6/23/2015 Priority to 3/2/2010	**Pending**	**Claim 1:** A method executed by a computer system comprised of a first register instance and a server for managing at least one open checks comprising: displaying on the display screen of the computer operating the first register instance at least one icon, each displayed icon corresponding to an open check associated with the first register instance; receiving into the first register instance a selection of at least one of the displayed open checks; displaying on the display screen of the computer operating the first register instance at least one identifier associated with a second register instance; uploading to the server a data message comprised of the identifier associated with the second register instance and identifiers that correspond to one of the at least one selected open checks; updating the data structures stored on the server corresponding to one of the selected open checks to refer to the identifier associated with the second register instance; and transmitting to the second register instance data comprising one of the at least one updated open checks.	
Graphical User Interface for a Point of Sale Device	SK___9 D	US	29/500,834 **D746,851**	Filed: 8/28/2014 Priority to 3/28/2012 Issued: 1/5/2016	**Issued**		Window to file renewal opens on January 5, 2019

A System and Method for Remote Management of Sale Transaction Data	SK__10 U	US	14/918,446	Filed: 10/20/2015 Priority to 2/28/2011	**Pending**	**Claim 1:** A system comprised of a plurality of computers connected in a network for managing multiple copies of a data item stored in each of the plurality of computers, where each of the plurality of computers is comprised of: a module adapted to receive connectivity information describing connectivity among the plurality of computers; and a module adapted to create a routing table for encoding the connectivity of the computer to the other plurality of computers.	
System and Method for Remote Management of Sale Transaction Data	SK__11	US	15/065,455	Filed: 3/9/2016 Priority to 3/2/2010	**Pending**	**Claim 1:** A method of managing retail transaction data comprising: receiving at a server from a first computer operating an instance of register software a user login identifier and a register login identifier; verifying the register login identifier by querying a database using the register identifier to verify its validity and to determine a vendor account data value associated with the register instance; verifying the user login identifier by querying a database using the user login identifier to confirm that the user login identifier is validly associated with a vendor account data value; and transmitting at least one security key value to the first computer. Receiving from the first computer data representing at least one transaction, said data comprised of the transmitted security key; verifying the received security key; extracting data representing an inventory change value; and updating a database record comprised of an inventory value stored on the server that is associated with the vendor account to modify the inventory value by the amount of the inventory change value.	

Method and System for Secure Key Rotation	SK_13	US	15/921,039	Filed: 3/14/18 Priority: 3/13/13	**Pending**	**4. Claim 1:** A computer system for executing electronic payment transactions while conducting a key rotation and re-keying comprising: a transaction server comprised of memory comprised of a first decryption key and a second decryption key corresponding to a first key identifier and a second key identifier stored in the memory, the transaction server further comprised of a data structure representing a key table, said key table comprised of data representing a third key identifier and a fourth key identifier; the transaction server further comprised of logic configured to: receive from the key table the third key identifier and the fourth key identifier; receive a first encrypted data representing a first payment token encrypted by a third encryption key and a second encrypted data representing the first payment token encrypted by a fourth encryption key, each of the third and fourth encryption keys corresponding to the third and fourth key identifiers comprising the key table; determine which one of either the third or fourth key identifiers correspond to the first or second key identifiers; select one of the first or second received encrypted data that corresponds to the determined one of the third or fourth key identifiers; and decrypt the selected received encrypted data using the one of the first or second decryption keys whose key identifier was determined to correspond to the third or fourth key identifier ; and a keying server comprised of logic configured to: receive the first and the second key identifiers, where the first key identifier corresponds to the youngest of the first or second encryption keys; receive the third and the fourth key identifiers; receive the first encrypted data and the second encrypted data; determine whether the pair of third and fourth key identifiers fail to correspond to the pair of first and second key identifiers, and in dependence on such determination, decrypting whichever of the first or second encrypted data corresponds to the fourth key identifier and re-encrypting the decrypted data using the first encryption key that corresponds to the younger of the first or second encryption keys.	

A SYSTEM AND METHOD FOR REMOTE MANAGEMENT OF SALE TRANSACTION DATA	SK_14	US	15/921,018	Filed 3/14/2018	**Pending**	A system for managing retail transaction data comprising: a first computer comprised of an instance of register software whose memory contains data representing an identifier unique to the instance of register software, and a unique identifier associated with an authorized user of the first computer, where the first computer is operatively connected to a server system using a data network, said register instance adapted by program logic to process point of sale transactions and transmit transaction data to the server; a server system connected to the first computer by the data network, said server system comprised of a database comprised of data records representing the received transaction data, each data record associated with the authorized user of the register instance that the transaction data was received from, by an owner tag that corresponds to each said transaction data records, said owner tag comprised of an identifier representing the authorized user of the register instance, each of said data records comprised of a corresponding data tag representing at least the logic state of open or closed, where the server system is further adapted by logic to modify the transaction data records as a result of the server system receiving from the first computer the identifier representing the authorized user and the server system verifying that the received identifier is associated with the user identifier comprising the owner tags; whereby the server system is further adapted by logic to receive from the register instance a data message representing the condition that the authorized user of the register instance has selected an end of shift command on the register instance and automatically in response to such reception, the server system automatically selecting from the database a plurality of the transaction data records associated with the authorized user by comparing the identifier representing the authorized user with the owner tag data associated with the transaction data records and changing the data tag corresponding to those selected data records to the closed state. **5.**
